

Complete Morphological, Syntactic, and Multi-Language Index of 109 Unique Headwords (29,345 Token Occurrences) | Dataset Version 6.0

In classical Arabic grammar, **Ḥarf (حرف - Particle)** represents the third primary part of speech alongside **Isim (اسم - Noun)** and **Fi'l (فعل - Verb)**. Unlike nouns and verbs, particles do not carry independent lexical meanings in isolation; rather, they function as vital syntactic operators that connect words, set case governance (*l'rab*), signal negation, introduce conditions, or convey emphasis across the Quranic text.

The **v6.0 Particle Catalog** provides 100% complete coverage of all **109 unique headword particle lemmas** in the Quran, accounting for **29,345 running word tokens** (37.90% of the entire 77,429 Quranic word token corpus). Combined with the 3,057 Noun lemmas and 1,450 Verb lemmas in v6.0, 100% of the Quranic vocabulary is now fully cataloged.
